.

We present the first results obtained at Bucharest Astronomical Observatory of the Romanian Academy in the PHESAT '95 Campaign.

The Bucharest Observatory has participated at the former campaign PHEMU '91 and has obtained some experience in this field.

To observe the mutual phenomena of Saturn's satellites, a Cassegrain 50 cm/750 cm telescope with an EMI 9502 B photomultiplier has been used. The observations period in Bucharest Observatory begun on May, 1995. We have used the ephemeris computed by BUREAU DES LONGITUDES - Paris.

The results for May and June 1995 are presented.
